

Implementation Documentation

The event flow of the system is; Push the pastry bags around the level to move them into their correct position and then hit them to release a dollop of icing to decorate the cake. Once all of the cakes have been decorated in accordance with the portraits on the wall, the door will open to the next level.

The designed event system improves the modularity and gameplay responsiveness by creating challenging puzzles where you have to move specific pieces into a specific place and then activate them all to complete the puzzle.

During the development I had a lot of struggles. Although I was able to eventually figure out almost all of the challenges that were presented to me, one challenge specifically I was not able to figure out despite many different attempts at doing so. That one challenge was getting the door to work. When it became clear that the door was not opening with what I was trying I switched to a different method. This method would be to create 3 different floats and set them to false and when the player would decorate a cake, the corresponding float would be set to true. Unfortunately this did not work in any way. Unity would continue to give me an error on `Door.setLock`, which would say I couldn't use it because it was a method. Through many trial and error I was still unable to open the door in any way, so I decided to try opening the door through the door script. Even though I was now in the door script I kept getting the "method" error and I couldn't open the door in any way. Eventually I tried deleting everything in the door script related to the door being locked to try and force it open. This worked but in the process stopped me from being able to push the pastry bags around preventing me/ the player from completing the level properly. I had to re add some of the deleted code and keep some others deleted and I was finally able to keep the door permanently open while keeping the pastry bags mobile.
